

Puppy Love

(I hesitate to include this profoundly distasteful news item, but we do not shrink from the truth here at the CofCC.)

A dog owned by a queer couple in Paris has become infected with *Monkeypox*, and an investigation by health authorities revealed it was also suffering from an “*anal ulceration*.”

According to the **TELEGRAPH** of London, in early June, two Parisian queers developed the symptoms of *Monkeypox*, and were admitted to a hospital where the condition was confirmed. Each complained of sore lesions in their anal regions one week after frolicking with other queers at a bathhouse.

12 days following the couple's admission to a hospital, their male Italian greyhound was also found to have developed lesions and pustules on its stomach.

In its relentless efforts to obscure the deviant practices of queers, the Jews' Media tried to imply that the dog's infection inadvertently resulted from close proximity to its owners. However, the Jews' Media neglected to mention that the dog also suffered from those “*anal ulcerations*.”

Evidence began to mount that these queers shared their dog sexually: A PCR Test revealed not only was the dog infected with *Monkeypox*, but that the strain infecting the dog had a perfect DNA match with that infecting its owners. This indicated that the dog contracted the infection from one or both owners.

The spread of *Monkeypox* occurs exclusively among gay men engaging in sex with each other or with monkeys. Its earliest outbreaks can be traced to a gay bathhouse in Spain.

Man Marries His Dog

Like many lies the Jews' Media relentlessly promote, one of the most galling is the lie that homosexuality is not a mental illness, and that queers are just like everyone else except for their sexual preferences. This particular claim should always be greeted with the greatest skepticism in the future.

Because of its distasteful origins, the CDC intends to rename *Monkeypox* to avoid any uncomfortable questions about its origins and its means of transmission. May I suggest "**Doggypox**" in honor of its first non-human victim?
