

One More Excuse

A recent "*study*" by the usual suspects concluded that woodland creatures are less likely to be present in black neighborhoods, and ghetto misbehavior is a result. Its authors claim that the greater diversity of wildlife in white neighborhoods is a result of segregated housing resulting from "**redlining**" before and after the 1968 ***Fair Housing Act***.

In other words, woodland creatures feel more comfortable living among whites, so this must be attributable to racism. The study also claims that the lack of biodiversity has negative impact on the physical and mental health of blacks, because they are "*deprived*" of the benefits of seeing wildlife in their "*hoods*." This incredibly ludicrous study appeared in ***Proceedings of the National Academy of Sciences***, exposing the extent of Cultural Marxism's invasion of what used to be "*science*."

Those of us with advanced degrees in ***Nigrology*** know better, and realize how laughable this supposedly "*scientific*" study is. One simple explanation for less biodiversity in n*gger neighborhoods is that whites are far more likely than blacks to put out food for wildlife, which would attract more of it to white areas. Deer, birds, squirrels, chipmunks and other wildlife flock to free food, just as surely as black welfare beneficiaries flock to government cheese.

Another fairly obvious explanation is the endless gunfire that pervades the night air in most black ghettos. Since n*ggers routinely gun each other down for little or no reason -- like flashing the wrong gang sign or wearing the wrong color -- I wouldn't put it past the nigs to take "*pot shots*" at any innocent wildlife they happen to see. Like most white people, wildlife also have a strong inclination to avoid gunfire, and migrate to areas where there is little or none of it.

In any event, the entire premise of the study is ridiculous. A quick *Google* search revealed an enormous and diverse population of lower species of animals living in black ghettos all across the nation. (See below.)

Although these images represent an extremely primitive species -- without the charm of deer or chipmunks or birds -- America's n*gger ghettos can hardly be said to be lacking in wildlife. In fact, the problem is that there are far too many of these examples of *Homo habilis* in our large, urban areas.
